MobileAsset v7: Checking In to a new location does not move the asset

Jason Whitmer - 2017-06-14 - 0 Comments - in Version 7

Symptom: When changing the asset's location during a Check In transaction on the mobile device, the pc client shows the asset was checked in, but it is not moved to the new

location.

Resolution: Please download and apply this patch to correct the issue with location not changing when assets are checked in to a different location:

http://dl.waspbarcode.com/wasp/supportfiles/MobileAsset_Patch_715.exe

This will not retroactively correct transactions that have already been entered, but new

transactions will work properly.
