MobileAsset v7: Employee Badge label has department_id rather than the department name or code

Jason Whitmer - 2018-07-26 - in Version 7

Symptom: When editing the Employee Badge in Labeler, there is a column in the data for department_id, but the number there does not match out Department Code or Department Name that we entered into Mobile Asset.

Cause: The id number shown is the record number SQL Server uses to reference the department data on a different database table.

Resolution: Download and extract this file on your database server machine:

<http://dl.waspbarcode.com/wasp/supportfiles/Assetv7EmpBadgeLabelView.zip>

If you are running the Enterprise version of MobileAsset and the database is installed to your own SQL Server, edit UpdateDB.wql with Notepad or similar text editor to replace server=(local)\waspdbExpress with your correct instance name, and set password= to your correct sa password.

Run FixEmployeeBadgeLabelView.bat to update the database view, and the next time you open the label, it should show two new columns: DeptName and DeptCode.
