Barcode printed on a colored background that will not scan.

Max Holden - 2017-04-10 - in WCS3900/3905/3950

This applies to all scanners

Barcode scanners require significant contrast between the bars and spaces in a barcode.

If the bars are black, the background needs to be a light color so that the scanner can tell the bars from the spaces.

If the background color is too dark, the barcodes will not scan.
