DMARC compliance

Scott Leonard - 2024-05-01 - FAQs

Is Wasp software's email sending DMARC compliant?

No, we are not specifically doing anything to be DMARC compliant. However, our software allows you to specify your own mail server and then have control of that.

==========

More information:

DMARC compliance **enables a sender to specify that their messages are protected by DKIM and/or SPF**, and lets receivers know what to do if an email isn't in DMARC compliance. Ultimately, DMARC email security prevents anyone except for authorized senders to send an email using an organization's domain.

DomainKeys Identified Mail (DKIM) is an email authentication method designed to detect forged sender addresses in email (email spoofing), a technique often used in phishing and email spam.

SPF is a special list, a whitelist, that includes everyone who is authorized to send messages on your behalf.
