InventoryControl v7: How to set up printing Add or Receive labels from a mobile device to a Bluetooth ZPL-compatible label printer

Scott Leonard - 2019-09-06 - in Version 7

InventoryControl's Windows Mobile/CE app can print labels to a Bluetooth ZPL-compatible label printer when performing an Add or Receive operation. This article discusses the steps needed to set this up.

Summary of steps (see expanded discussion below):

1. Bluetooth pair the printer to the mobile device.
2. Optional: Edit the label layout ZPL code.
3. On the mobile device, quit InventoryControl if it's running. Connect the device to a client

PC.

4. In the PC's InventoryControl, set up the device again, specifying mobile label printing settings.

Now on the device, when performing an Add or Receive operation, you can specify the number of labels to print. After tapping OK, the printer should print the label(s).

Note: If you get a message on the mobile device that says "The write timed out", this is due to a momentary communication problem between the mobile computer and the Bluetooth printer. Simply tap OK on the message, then OK again on the Add or Receive screen to resend the print job.

Expanded Discussion of Steps:

1. The following procedure was written to Bluetooth pair Wasp's WPL-4MB printer to an HC1 device. Other devices may have a different procedure.
Note for Zebra-branded QLn420 printer (among others): In the factory default configuration, the printer does not have a Friendly Name or Authentication Pin set, which are required for the HC1 to see the device. Use the Zebra Setup Utilities configurator to set those on the printer before performing the following procedure.

a. Main screen, tap Bluetooth. Wireless Manager opens.
b. Tap the word Bluetooth. The status changes to On.
c. Tap the Menu button at the bottom, Bluetooth Settings.
d. The default tab is Devices. Tap "Add new device...". Available Bluetooth devices appear in the list.
e. Tap your desired printer/device, then the Next button.
f. Enter the device's connection passcode, then tap Next. The device appears in the list.
g. Tap the device. Partnership Settings appears.
h. Check the box for Serial Port, then Save.
i. At the top, tap COM Ports, then New Outgoing Port.
j. If needed, tap the device to select it, then Next.
k. Change from COM0 to some other port (suggestion: COM5) and tap Finish.
l. If you get a message that "The COM port could not be created. Please check your settings and try again", tap OK, then select a different port, Then Finish again.

m. When this is successful, you'll see an entry with your device name and the COM port in the list. Note the port number for later use.

n. Tap OK.

2. This step is optional. If you don't customize the label, the default layout shows the item description, item number barcode, and item number.

Download and extract the following file:
http://dl.waspbarcode.com/kb/ic/v7/i_ItemNumber.zip

Contents of the zip file:

i_ItemNumber.txt: The ZPL code that is sent by default.

i_ItemNumber all fields.txt: ZPL with references to all available label fields.

i_ItemNumber - code with notes.txt: Contains notes about the file and ZPL commands used.

Then use a text editor such as Notepad to edit the "i_ItemNumber.txt" file's ZPL code as desired. The ZPL Programming Guide (which contains some exercises) is linked below in Related Pages. Note that Wasp Tech Support doesn't offer any other programming lessons or debugging service.

The edited "i_ItemNumber.txt" file should be placed in the PocketPC folder inside InventoryControl's installation folder (on a PC where the mobile device is connected and set up). Default paths:

64-bit Windows: C:\Program Files (x86)\Wasp Technologies\InventoryControl\PocketPC

32-bit Windows: C:\Program Files\Wasp Technologies\InventoryControl\PocketPC

3. On the mobile device, quit InventoryControl if it's running. Using a data cable, connect the device to a client PC, the same as when initially setting it up or for batch mode communication.

4. In the PC's InventoryControl, Mobility section, either Windows Mobile / CE (Batch) or (Wireless) option, Setup Mobile Device again.

On the Printing Setup screen, use these settings:

Do you plan to print from the mobile device? Yes

Yes, I will be printing with a

Label Mobile Printer

COM Port: Use the full port name that you set during the Bluetooth pairing section above (don't use just the number). For example:

Wrong: 5

Right: COM5

Baud Rate: Match the setting from your device. 9600 should be safe if you don't know. Other valid values are: 14400, 19200, 38400, 57600, 115200.
