Labeler integration with QuickBooks on Right Networks' cloud computing servers: Not possible

Scott Kircher - 2017-04-10 - in Version 7

User is working with [Right Networks](#) cloud-based computing service which hosts QuickBooks. Can they install Labeler to the server in order to integrate with QuickBooks?

No.

In this setup, the user creates a Remote Desktop connection to the Right Networks server. After connection, the user sees a mostly-blank desktop with a QuickBooks icon. The user does not have permissions to perform an installation, and they have no access at all to the server's C: drive, which is required for Labeler installation and operation (specifically, the programdata and Program Files folders).
