WaspTime: After installing WaspTime & PCPunch on a Win 2003 Server, all users have lost the ability to run certain jobs. What permissions have been reset and how to correct the issue?

Max Holden - 2017-04-10 - Software

In the WaspTime install certain files in your Windows and Windows32 folder may be replaced if needed. The following files are possibly replaced as part of the WaspTime install. It is possible for permissions to get changed depending on the permissions of the folder they are copied into and the permissions of the user logged in durring install. Check the permissions on the files below and make sure that they are correct. The most likely file is msvcr71.dll. It has been known to cause these problems if one of the permissions is missing. The most usual permission to be lost is the <local>\Users permissions for read and execute.

mfc42.dll

msvcp60.dll

pg32conv.dll

sscsdk80.dll

msvcr71.dll

msvcrt.dll

filecontrolp.ocx

sc.exe
